

Nathan Ly – The Busy CS Student

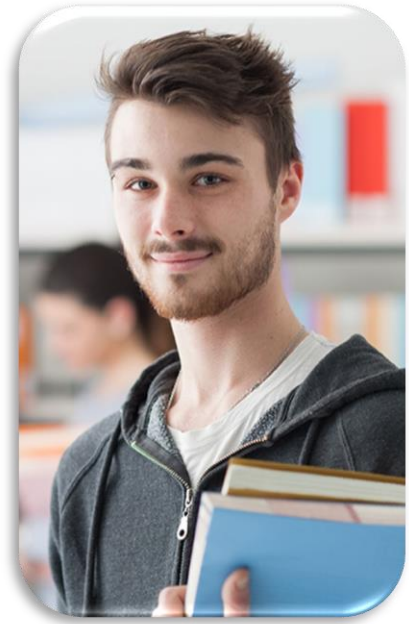

Nathan is a 20 year-old male York student. He is currently in first year of his Computer Science program. He lives off-campus, commutes 1.5 hours each way, and he is also trying to balance full course load together with his part time job. Since Nathan is a new student at York, he is extremely curious about everything at school, including clubs and events at York University

However, Nathan lives too far from school and finds it hard to manage his hectic schedule properly, which makes him feels disconnected from campus life. Besides, he is struggled in manually search and track events scattered across multiple social media platform like Instagram, Discord, University Website,...

As a result, he prefers a one-stop, user-friendly way to get all the upcoming events and updates from school. Besides, it can help to filter clubs and activities based on his hobby and schedule, so he does not need to spend too much time just to browse the whole website. For Nathan, saving more time searching for events and having such a user-friendly platform that help him to get up to date information about those activities and updates will be a key to make him feels connected to the university life

Alex Kim – The Ambitious Club Exec

Alex is a third-year student in Business Administration at York University, and currently serve as the President of Yorku Chess Club. He's passionate about building a strong community of like-minded students and wants to create meaningful events that can bring everyone together, as well as find more people who are interested in Chess in order to improve his networking skill

However, being a President of a club requires him to join a lot of meetings, manage club members, expense...which make him feel extremely suffocate and that affect the quality of every events he made. As a result, despite the club hosting great event, attendance is often lower than he expected because most student never hear of them

As a leader, Alex need to do something to change this situation. However, he is actually not a tech-savvy, and managing multiple social media channels like Instagram, Discord, and also club website feels messy and time-consuming. Every new event requires him to manually create posts, sending announcements, and reminders on all over those platform

Alex wants a smarter and easier way to promote his club's activities. He is looking for a system where he can upload every event details once and have them automatically shared across platforms, or even a Discord bot that keep his community informed in real time. Allowing a scraper to pull event directly from the club website's could save him hours each week. For Alex, efficiency and time saving are everything

Somar Abuaziza – YFS President

Somar is a forth-year Political Science student and currently serve as a Vice President of YFS. He role revolves around overseeing student engagement and ensuring that all on-campus activities run smoothly and inclusively. She work closely with club executives, faculty representatives, and event organizers to coordinate student life across YorkU's multiple campuses

However, communicating between dozens of active clubs and department feels like chaos. Somar spends hours every week just to track upcoming events, verify permission, and make sure that the schedule won't overlap. Recently, she feels so frustrated managing everything because events are announced through emails, Discord servers, Instagram pages, and Google Forms – all maintained by different clubs. Because there is no centralized system, she often finds out about activities after they have already happened. Hence, Somar worries that YFS is losing its value into campus involvement

She wants a centralized event dashboard – a single platform where she can easily view, filter, and manage all on going and upcoming student activities. Ideally, this tool would automatically gather event data from club websites or Discord bots, eliminating the need for manual tracking. Having access to accurate, real-time information could help her to coordinate better between departments, allocate resources efficiently, and identify which group need more support
